## SCHMÖL CERAMIC ENGINE PROTECT

With the new SCHMÖL Ceramic Engine Protect, we rely on state-of-the-art ceramic technology that reliably protects engines against wear, extends their service life, and ensures noticeably smoother operation.

September 2025

### SCHMÖL CERAMIC ENGINE PROTECT – ADVANCED PROTECTION FOR MODERN ENGINES

Modern engines are exposed to extreme thermal and mechanical stress on a daily basis. **SCHMÖL Ceramic Engine Protect** was developed as a high-performance wear protection additive for petrol and diesel engines to meet these challenges. The product combines **organic friction modifiers** with **fine ceramic particles**. This combination ensures stable and reliable wear protection as well as effective friction reduction in all load ranges – from low to very high loads.

The **innovative ceramic particle technology** forms an extremely resistant protective layer on all metal surfaces subject to friction. This layer is characterised by maximum temperature and oxidation resistance and remains stable even under extreme loads. This results in excellent **emergency running properties**. In addition, the use of fine particles ensures that the **oil filter does not become clogged**.

Your advantages at a glance:

- Significantly reduced friction and wear throughout the load range
- Noticeably improved engine performance and smooth running
- Optimised fuel and oil consumption
- Longer engine service life
- Long-term protection up to 50,000 km

SCHMÖL Ceramic Engine Protect – developed to keep modern engines running at peak performance.
